Re: Product / Supply Chain Awards

ADX Electrical specialises in Hazardous Area Installations and as a result we have used various QuickStop glands on numerous projects over many years.

We chose CCG Glands solely for our most recent project of which we used in excess of 5000 units. Our reasoning for use of the CCG QuickStop gland was ease of installation, simple yet highly efficient design, cleanliness of end result along with accurate filling of voids around the cable ensuring optimum safety of the installation.

The resin filling also increases the speed at which the CCG Quickstop glands are installed. Setting within the hour means for much quicker installation as well as a cleaner application. In the past the electrician has had to put on gloves and mould putty into the gland, this resin application is safer and cleaner for both the electrician and the finished product.

Inspections on the CCG Quickstop glands are simple to conduct and all areas of the gland and cable are able to be checked. This helps to reduce the amount of down time spent when Hazardous Area Inspections are performed.
